Individual Stock Metrics — Data Legend

This document explains every metric in the single-company **deep-dive** view and in its Excel export (`TICKER-YYYYMMDD.xlsx` , produced by the "⬇ Export" button on a company's deep-dive page). It is intended as a reference for a human or an AI assistant interpreting that spreadsheet.

The export has five sheets: **Overview**, **Charts Data**, **Income Statement**, **Balance Sheet**, and **Cash Flow**. Each is documented below. The deep-dive page also offers a second, DCF-specific export (`TICKER-DCF-YYYYMMDD.xlsx` , the "⬇ DCF" button) — see **The DCF export** near the end of this document.

> **Units cheat-sheet.** This workbook uses **one convention for every rate**: all margins, returns, yields, growth rates, payout and short interest are stored as **decimal fractions** — multiply by 100 for a percentage. So `0.478` = 47.8%, `0.0038` = 0.38%. This matches the multi-ticker screener export (SCREENER_COLUMNS.md), so the same metric reads the same in both files. The other value types are: - **currency** — an absolute amount. For most tickers this is simply the company's one currency, shown as **Currency** near the top of the Overview sheet. For a foreign-reporting ticker (an ADR like WIT, which trades in USD but reports in INR) it isn't one currency: **Price, Market Cap, Diluted EPS** are in the trading currency (**Currency**), while **Enterprise Value, Revenue, Cash, Debt, Equity, EBITDA, Net Income, FCF, Basic EPS, Dividend TTM** and similar statement-derived figures are in the reporting currency (**Financial Statement Currency**, shown only when it differs from Currency). See §11 in METRICS.md for why. Per-share values are per single share. - **multiple (×)** — a valuation/coverage ratio (P/E, EV/EBITDA, FCF Coverage). - **ratio** — a plain liquidity ratio (Current, Quick). - **number / integer / date / share count** — as labelled.
>
> (The on-screen deep-dive **view** shows these metrics formatted as percentages, e.g. `47.8%` ; the export stores raw fractions so they are calculation-ready.)
>
> All data comes from Yahoo Finance via `yfinance` and may be delayed, restated, or missing (empty cell = `N/A`). "Good/bad" ranges are rough rules of thumb that vary by sector, business model, and growth stage — judge against the company's own history and direct peers.

Sheet 1 — Overview

Top rows carry identity: **Ticker — Name**, then **Sector**, **Industry**, **Exchange**, **Currency** (the currency the stock trades in — Price and Market Cap are in this currency), **Price** (latest share price), and **Change** (intraday price change, **fraction**). A **Financial Statement Currency** row appears here too, only for a foreign-reporting ticker whose statements are denominated in a different currency than it trades in — see the units cheat-sheet above and METRICS.md §11.

Below that, metrics are grouped into the same panels shown in the app.

Valuation

Metric	Meaning	Units	Rough read
Market Cap	Share price × shares outstanding — total equity value.	currency	Size bucket.
Enterprise Value	Market cap + debt − cash. Cost to acquire the whole business.	currency	Used in EV/EBITDA.
Trailing P/E	Price ÷ trailing 12-month EPS.	multiple (×)	<15 cheap-ish, 15–25 average, >25 priced for growth.
Forward P/E	Price ÷ estimated next-year EPS.	multiple (×)	Below trailing P/E implies expected growth.
PEG Ratio	P/E ÷ expected earnings growth.	ratio	~1.0 fair; <1 potentially cheap; >2 expensive.
Price/Book	Price ÷ book value per share.	multiple (×)	<1 below book; 1–3 typical.
Price/Sales	Price ÷ trailing 12-month revenue per share.	multiple (×)	<1 low, >10 rich.
Price/Cash	Market cap ÷ total cash.	multiple (×)	Lower = more cash backing the valuation.
Price/FCF	Market cap ÷ free cash flow.	multiple (×)	<15 attractive, >25 expensive. Blank if FCF ≤ 0.
EV/EBITDA	Enterprise value ÷ EBITDA.	multiple (×)	<10 cheap, 10–15 average, >15 expensive.
DCF Value	Inferred fair value per share — 10-year two-stage FCFF DCF discounted at WACC (methodology: METRICS.md §2). Trading currency.	currency / share	Compare against Price. Blank for financials/ REITs. Use the ⬇ **DCF** button for the full working.

Metric	Meaning	Units	Rough read
DCF Upside	DCF Value ÷ Price − 1 (labelled "DCF Upside %" in the app; exported as a fraction).	fraction	>0 = model reads it below fair value; <0 above.
EPS	Trailing 12-month earnings per share.	currency / share	Higher and rising is better.

Dividend

Metric	Meaning	Units	Rough read (as fraction)
Dividend Rate	Forward annual dividend per share.	currency / share	—
Dividend TTM	Dividends actually paid per share, trailing 12 months.	currency / share	—
Dividend Yield	Annual dividend ÷ price.	fraction	<0.02 low, 0.02–0.04 typical, 0.04–0.06 high, >0.07–0.08 cut-risk.
Payout Ratio	Dividends ÷ earnings.	fraction	<0.60 comfortable, 0.60–0.80 watch, >1.0 unsustainable.
FCF Coverage	Free cash flow ÷ dividends paid.	multiple (×)	≥1.2 safe, 0.8–1.2 tight, <0.8 under-covered.
Ex-Dividend Date	Buy before this date to receive the next dividend.	date	—
5Y Avg Yield	Average dividend yield over the past 5 years.	fraction	Context for today's yield.
Div Growth 3Y	Annualized dividend CAGR over 3 years.	fraction	Positive growth = healthy payer.
Div Growth 5Y	Annualized dividend CAGR over 5 years.	fraction	Longer track record.
Years ▲ Dividend	Consecutive completed years of rising dividends.	integer (years)	10+ strong culture, 25+ "dividend aristocrat".

Profitability

Metric	Meaning	Units	Rough read (as fraction)
Gross Margin	(Revenue − cost of goods) ÷ revenue (Yahoo's TTM figures — Yahoo derives its own gross profit and revenue base, so this can differ from the fiscal-year statement margin in Charts Data).	fraction	>0.40 strong (software 0.70+, retail <0.30).
Operating Margin	Operating income ÷ revenue (Yahoo's TTM figures — Yahoo derives its own operating income and revenue base, so this can differ, even in sign, from the fiscal-year statement margin in Charts Data).	fraction	>0.15 healthy; negative = core ops lose money.
EBITDA Margin	EBITDA ÷ revenue.	fraction	>0.20 generally strong.
Profit Margin	Net income ÷ revenue (Yahoo's TTM figures — Yahoo derives its own net income and revenue base, so this can differ from the fiscal-year Net Margin in Charts Data).	fraction	>0.10 solid, >0.20 excellent, negative = unprofitable.
ROE	Net income ÷ shareholders' equity.	fraction	>0.15 good; can be inflated by leverage.
ROA	Net income ÷ total assets.	fraction	>0.05 decent; banks/utilities lower.
ROIC	After-tax operating profit ÷ (debt + equity).	fraction	Creates value only when > cost of capital (~0.08–0.10). >0.15 excellent.
WACC	Weighted average cost of capital: (equity weight × CAPM cost of equity) + (debt weight × after-tax cost of debt). Cost of equity = 10Y Treasury + Beta × 5.5% equity risk premium (a fixed US-market estimate — see METRICS.md §3).	fraction	Benchmark for ROIC; typically 0.06–0.12.

Metric	Meaning	Units	Rough read (as fraction)
ROIC − WACC	ROIC − WACC.	fraction	>0 value creation, <0 value destruction. Blank if either input is missing.
ROCE	EBIT ÷ (total assets − current liabilities).	fraction	>0.15 strong; pre-tax sibling of ROIC.
Revenue/ Share	Trailing 12-month revenue ÷ shares outstanding.	currency / share	Rising is the signal to want.
Net Income	Net income to common shareholders (Yahoo's trailing 12 months — its window and definition differ from the fiscal-year statement figure in Charts Data, so the two can disagree).	currency	Positive and growing is the goal.

Financial Health

Metric	Meaning	Units	Rough read
Total Cash	Cash + short-term investments.	currency	Compare to total debt.
Total Debt	Short- + long-term borrowings.	currency	Judge against cash, equity, EBITDA.
Total Equity	Assets − liabilities (book value).	currency	Negative is a red flag.
Debt/Equity	Total Debt ÷ Total Equity, computed from the two figures in this panel so they reconcile.	fraction	<1.0 conservative, 1.0–2.0 moderate, >2.0 aggressive.
Debt/Equity (MRQ)	Yahoo's pre-computed Debt/Equity from its most-recent-quarter balance sheet.	fraction	Same ranges; differs from Debt/Equity when the latest quarter has moved since fiscal year-end.
Debt/ EBITDA	Total Debt ÷ EBITDA — years of EBITDA needed to repay all debt.	multiple (×)	<3× comfortable, 3–4× watch, >4–5× heavily leveraged.
LT Debt/ Equity	Long-term debt ÷ shareholders' equity.	fraction	Long-term portion of leverage.
Current Ratio	Current assets ÷ current liabilities.	ratio	>1 covers near-term bills; 1.5–3 comfortable.
Quick Ratio	(Current assets − inventory) ÷ current liabilities.	ratio	>1 strong; stricter than current ratio.
Free Cash Flow	Operating cash flow − capital expenditure.	currency	Positive and growing is the goal.
EBITDA	Net Income + Interest + Tax + Depreciation & Amortization — built up from the bottom line, not down from revenue (Yahoo's TTM figure — the same one behind Debt/EBITDA and EBITDA/FCF).	currency	Proxy for operating cash earnings; compare to debt and FCF.
EBITDA/ FCF	EBITDA ÷ Free Cash Flow — how much EBITDA it takes to produce a dollar of free cash.	multiple (×)	Closer to 1× = cleaner cash conversion.

REIT Metrics

Present **only for REITs** (the panel is omitted entirely for every other company). Which rows appear depends on which of three REIT kinds the company is — the app decides this from its industry and its statements, and the panel is titled "Mortgage REIT Metrics" for the third:

- **Equity REIT** — owns depreciable buildings under US GAAP, so FFO is computable and the FFO family is shown.
- **Fair-value REIT** — also owns buildings, but reports them at fair value under IFRS (most Canadian REITs). There is no depreciation line to add back, so FFO can't be built; the book-value rows are shown instead. Book value ≈ NAV here, and Net Income swings with unrealized property revaluations.
- **Mortgage REIT (mREIT)** — owns mortgage securities, not property. FFO is meaningless by construction, so the book-value rows are shown.

Metric	Meaning	Units	Rough read
FFO	Funds From Operations = Net Income + D&A − property-sale gains + impairments. The REIT-standard earnings measure: property depreciation is a large non-cash charge that buildings usually don't actually incur, so net income understates a REIT's earning power. Equity REITs only.	currency	Compare to debt and the dividend, as FCF is used elsewhere.
FFO/Share	FFO ÷ shares outstanding — the REIT analogue of EPS.	currency / share	The per-share earning power the dividend comes from.
P/FFO	Market cap ÷ FFO — the REIT equivalent of P/E, and the sector's standard multiple.	multiple (×)	<12× cheap-ish, 12–18× typical, >18× rich.
FFO Payout	Dividends paid ÷ FFO. REITs must distribute ~90% of *taxable* income by law, so this runs structurally higher than a normal payout ratio.	fraction	≤0.80 comfortable cushion, ≤1.00 sustainable, >1.00 paying out more than FFO generates.
FFO Coverage	FFO ÷ dividends paid (the inverse of FFO Payout).	multiple (×)	≥1.0× sustainable, <1.0× under-covered.
Book Value/ Share	Shareholders' equity ÷ shares outstanding — net asset value per share.	currency / share	The primary gauge for mortgage and fair-value REITs; ≈ NAV for a fair-value REIT.
Book Value Trend	Annualized trend of book value per share, least-squares-fitted across all available years so one anomalous year can't set it. Mortgage and fair-value REITs.	fraction	The single most important mREIT quality signal. >0 compounding; persistently <0 means the dividend is being paid out of capital.
Price/Book	Price ÷ book value per share.	multiple (×)	<0.90 discount to the portfolio, >1.10 premium — the primary valuation anchor for mortgage REITs.
Net Income	Net income to common shareholders. Mortgage and fair-value REITs.	currency	For a fair-value REIT this includes unrealized property revaluations; for an mREIT, mark-to-market swings. Read the trend, not one period.
Div Coverage (NI)	Net income ÷ dividends paid. Mortgage and fair-value REITs.	multiple (×)	<1.0× means distributing more than it earns — a common mREIT warning sign.
Debt/GBV	Total Debt ÷ **gross book value** (total assets with accumulated depreciation added back — the asset base at undepreciated cost). Property REITs only: equity and fair-value kinds.	fraction	<0.45 conservative, 0.45–0.55 typical, >0.60 highly levered.

Why Debt/GBV rather than plain debt-to-assets. It is the leverage gauge property REITs actually report and covenant against — declarations of trust commonly cap it near 60%. Measuring debt against the *undepreciated* asset base matters for the same reason FFO adds depreciation back to earnings: accounting depreciation shrinks the carrying value of buildings that usually haven't lost value, so debt-to-assets overstates how levered a property REIT really is. Two data caveats: Yahoo carries US-GAAP REIT property at **net** value with no accumulated-depreciation row to add back, so for those REITs the figure runs slightly **high** (conservative); for fair-value REITs it is exact, since their assets already sit at fair value and that is precisely how their covenants define it. Mortgage REITs are excluded — "gross book" has no meaning for a securities portfolio, and their repo financing isn't fully captured in Total Debt, so the ratio would understate their real leverage.

Occupancy rate is not available. It is the one headline REIT metric this export cannot carry: occupancy is an *operational* disclosure published in each REIT's quarterly supplemental package, not a financial-statement line, so no normalized data feed (Yahoo included) provides it. Read it from the REIT's own supplemental. See REITs.md for the full REIT methodology.

Risk

Metric	Meaning	Units	Rough read
Beta	Sensitivity vs. the market (S&P 500).	number	1 = with market; >1 amplified; <1 stabler; <0 inverse.
Short Interest	Shares sold short ÷ public float.	fraction	<0.05 normal, 0.05–0.10 elevated, >0.10–0.20 heavily shorted.

Metric	Meaning	Units	Rough read
Days to Cover	Short interest ÷ average daily volume.	number (days)	<1 easy; >5–7 crowded short.
Altman Z-Score	Bankruptcy-risk gauge (higher = safer).	number	>2.99 safe, 1.81–2.99 grey, <1.81 distress. Ignored for financials/REITs/mortgage REITs; softened to a flag (not a kill) for asset-light and cyclical names — see business-type archetypes.
Piotroski F-Score	Fundamental strength across 9 tests (1 pt each).	integer 0–9	7–9 strong, 4–6 middling, 0–3 weak. Replaced by ROE/net-margin for financials and REITs, and by book-value-per-share trend for mortgage REITs.

Strategy Ratings

This company graded against three long-term investing strategies, each 0–100 (unlike every other metric in this sheet, these are **not** fraction-scaled — the raw score out of 100 is exported directly). Computed server-side from the same underlying metrics shown elsewhere on this sheet, so a blank input anywhere can lower a score (missing data never helps a stock).

Metric	Meaning	Units	Rough read
S1 · Triage	Triage framework grade: data-hygiene quarantine → hard kill-switches (distress, twin-negative earnings, leverage, liquidity, value destruction) → quality score across value creation, profitability, balance sheet, cash conversion.	integer 0–100, or text	≥65 "Advance", 45–64 "Watchlist", <45 "Discard". Reads as `N/A` in the Overview panel value when quarantined (a critical field like Total Debt or Net Income is missing and unrecoverable) — the reason is shown instead.
S1 · Flags	Triage Stage-0 sanity + Stage-3 valuation-context flags. Never disqualifying — they tell the deep dive where to look first: priced for perfection · suspiciously cheap · ⚠ divergent multiples / data-sanity warnings · payout stress · crowded short · high beta.	text	`N/A` = no warnings (or S1 quarantined).
S2 · Compounder	Quality Compounder grade: returns on capital (ROIC/ROCE/ROE), margin moat, capital discipline, 5Y/10Y compounding track record, valuation sanity. A distress or twin-negative-earnings guard caps the score at 35.	integer 0–100	≥70 "Compounder", 50–69 "Quality watch", <50 "Pass".
S3 · Defensive Value	Defensive Value grade: Graham-style margin of safety — earnings/cash yield, asset backing (incl. P/E × P/B ≤ 22.5), financial strength, earnings quality, dividend record.	integer 0–100	≥70 "Value candidate", 50–69 "Fair", <50 "Expensive/weak".
Min · All Strategies	The minimum of the three scores above — the "good under every lens" figure.	integer 0–100, or blank	Blank when any strategy above is ungradable (e.g. S1 quarantined).

In the exported Overview sheet, each strategy's cell reads as `"<score> / 100 — <verdict>"` (e.g. `71 / 100 — Advance`) rather than a bare number, so the grade and its interpretation travel together in one cell. Financials (banks, insurers) are graded on each strategy's own documented sector substitution rather than the metrics above.

Sheet 2 — Charts Data

Three stacked tables, each keyed by fiscal **Year**. The oldest year is often blank — Yahoo's free feed reliably populates ~4 fiscal years, and the growth table needs a prior year per bar, so it shows one fewer.

Revenue · Profit · Net Income · FCF

Column	Meaning	Units
Year	Fiscal year.	year
Revenue	Total sales.	currency
Gross Profit	Revenue − cost of goods sold.	currency
Operating Income	Profit after running the business, before interest & tax.	currency

Column	Meaning	Units
Net Income	Bottom-line profit attributable to shareholders (fiscal-year statement — can differ from the Overview sheet's TTM Net Income, which Yahoo derives itself).	currency
FCF	Free cash flow = operating cash flow − capex.	currency
Gross Margin	Gross profit ÷ revenue (from the fiscal-year statement — can differ from the Overview sheet's TTM Gross Margin, which Yahoo derives itself).	fraction
Operating Margin	Operating income ÷ revenue (from the fiscal-year statement — can differ from the Overview sheet's TTM Operating Margin, which Yahoo derives itself).	fraction
Net Margin	Net income ÷ revenue (from the fiscal-year statement — can differ from the Overview sheet's TTM Profit Margin, which Yahoo derives itself).	fraction

Growth · YoY

Column	Meaning	Units
Year	Fiscal year.	year
Revenue Growth	Year-over-year growth in total revenue.	fraction
EPS Growth	Year-over-year growth in earnings per share.	fraction
EBITDA Growth	Year-over-year growth in EBITDA.	fraction
EBITDA Margin	EBITDA ÷ revenue for that fiscal year (shown as a line on the chart).	fraction

Share Dilution

Column	Meaning	Units
Year	Fiscal year.	year
Shares Outstanding	Shares held by investors, excluding treasury. Falling = buybacks; rising = dilution. Reconstructed as issued − treasury where Yahoo has no outstanding row; renamed **Shares Issued (incl. treasury)** in the rarer case where there is no treasury row to net off either, since the level may then run high.	share count
Treasury Shares	Repurchased shares held by the company (often ~0 when retired). Excluded from shares outstanding.	share count
Dividend Yield	Historical yield = annual dividends ÷ year-end price.	fraction
Payout Ratio	Dividends as a share of earnings, per year.	fraction

Sheets 3–5 — Income Statement / Balance Sheet / Cash Flow

Each statement sheet (annual) has **Line Item** in column A, then a leading **TTM** column, then one column per fiscal-year-end date. Values are in the company's reporting currency. The set of line items is whatever Yahoo provides for that company (e.g. Total Revenue, EBIT, Net Income; Total Assets, Total Debt, Stockholders Equity; Operating Cash Flow, Free Cash Flow). The oldest fiscal-year column is frequently blank.

The leading column: - **Income Statement & Cash Flow** → `TTM` (trailing twelve months) = the sum of the four most-recent quarters. Present only when a full year of quarterly data exists; a row is left blank if it isn't reported in all four quarters. - **Balance Sheet** → `MRQ` (most-recent quarter). A balance sheet is a point-in-time snapshot, so summing quarters would be meaningless — this column is simply the latest quarter-end balance.

This TTM revenue is the denominator behind the TTM-based ratios on the Overview sheet (e.g. margins), which is why those ratios use the TTM column's revenue, not the latest *annual* revenue.

`EBITDA (Yahoo TTM)` **row** (income statement only): an extra line carrying Yahoo's own trailing-12-month EBITDA — the figure behind the **EBITDA Margin** metric. It populates the TTM column only. It usually differs from the statement's own **EBITDA / Normalized EBITDA** line (a different, often higher, definition), and is shown beside it so EBITDA Margin (Yahoo EBITDA ÷ TTM revenue) can be reconciled.

The DCF export (⤓ DCF button)

A second, separate export on the deep-dive page: `TICKER-DCF-YYYYMMDD.xlsx`, a single **DCF Valuation** sheet that shows every input and intermediate step behind the screener's **DCF Value** column (methodology: METRICS.md §2). The button appears only when a DCF exists for the stock — financials and REITs (where an FCF model doesn't fit) don't get one.

It is a live spreadsheet model, not a static dump. The input cells (base FCF, growth, WACC components, debt, cash, shares, FX) hold plain values; **every downstream cell holds an actual Excel formula** referencing those inputs — the growth fade, each year's projected FCF and discount factor, the present values, the terminal value, the whole enterprise → equity → per-share → DCF-Value bridge, and the WACC composition. So you can trace exactly how each number was reached, and if you edit an assumption (say, the terminal growth or a projected year's growth) the valuation recomputes in your spreadsheet app.

Sections:

- **Result** — DCF Value (trading currency), current price, upside (**fraction**, like every rate in these exports). When the DCF is N/A a **Why N/A** row states the exact reason (business type, FCF ≤ 0, WACC unavailable or too close to terminal growth, shares missing).
- **Inputs** — business-type archetype, base FCF, raw historical FCF CAGR and the clamped stage-1 growth actually used, terminal growth, horizon, WACC, debt, cash, shares outstanding (flagged when derived from market cap ÷ price), and both currencies plus the FX rate for foreign-reporting tickers.
- **WACC breakdown (CAPM)** — beta, risk-free rate, ERP, cost of equity/debt, tax rate, capital weights, and the WACC formula result.
- **Historical FCF** — the statement series the growth rate came from, with YoY growth per year.
- **Projection** — one row per forecast year: fading growth rate, projected FCF, discount factor, present value; plus the terminal-value row.
- **Valuation bridge** — PV of the forecast years + PV of terminal value = enterprise value, − debt + cash = equity value, ÷ shares (× FX for ADRs) = DCF Value, against the current price.

All rates are stored as decimal fractions with a percent display format; currency amounts are raw values in the currency stated in each row label.

Not in the export

The deep-dive page also shows an **Earnings & Splits Calendar** (next earnings date, EPS/revenue estimates, recent earnings surprises, stock-split history), an interactive **Price** chart, and a **ROIC vs Cost of Capital** chart (ROIC bars against a per-fiscal-year WACC line — every input except beta reconstructed historically, not today's WACC repeated; see METRICS.md §8). These are not part of the Excel export.

See SCREENER_COLUMNS.md for the multi-ticker screener export, and METRICS.md §6 for the strategy-rating methodology in plain language.
